NTX Access V2 is the next generation of enterprise access and billing control software from Internet Transaction Services, Inc. Founded in 1996, iTrans is a private corporation dedicated to providing high-performance scalable solutions for the Internet.

NTX Access V2 is a suite of distributed applications that allow you to integrate control, tracking and billing of services, utilities, inventory items and more. Using a modular, distributable and extensible design, you can run all the applications on one server or distribute them across your network to suit your needs.

The Open Database (ODBC) design allows you to implement the most appropriate back-end database for your needs. You can leverage the power of your database to integrate with other applications such as backup and e-mail.

The *NTX Access V2* suite of applications provide high-performance, scalable solutions for small businesses to large corporations. Written in C++, the applications are designed be efficient and scalable. A COM application interface provides an extensible set of services that you can call from your own custom applications if you need them.

The following diagram shows the application modules on a typical network and are described below.

NTX Access Administrator Web

The Web interface makes it easy to manage everything from your browser. With *NTX Access*, managing your Accounts and Services is as easy as browsing the web!

NTX Access Control Services

NTX Access Control Services provides high performance Authentication, Access and Accounting (AAA) services via RADIUS and DIAMETER. With *NTX Access Control Services* you can use the power of templates and rules based processing to customize your network service configurations. You can also implement rule and name proxies to other services such as a Windows NT Domain or i-Pass. Features also include:

- Real-time session monitoring
- Date/Time restrictions
- Rules based configurations
- Supports Firewall, VPN, voice, fax and other customizable services
- Unlimited Proxy support for external authentication
- Configuration Templates

NTX Billing Control Services

NTX Billing Control Services makes it easy to establish service plans. You can specify multiple levels of service usage, time-of-day rates, discount and taxation rules. You can automatically generate, print and e-mail invoices and reports based on service usage (e.g. time and / or bandwidth, type of service). The *Enterprise Edition* also supports point-of-sale and online shopping interfaces for inventory items and services.

such as dial-up, firewall, web, ftp, VPN, proxy and other services

NTX Charge Control Services

NTX Charge Control Services allows you to import ftp, web and proxy server data for billing and logging purposes.

NTX Debit Control Services

NTX Debit Control Services automatically debits your client accounts upon billing via an external EFT application (e.g. IC Verify).

NTX Access Consumer Web

There are also web consumer products available that allow your end-users to view their usage and modify their account information.

NTX Access V2 is available in several Editions to best suit your needs:

◆ Corporate Edition

The *Corporate Edition* provides high performance Authentication, Access and Accounting (AAA) services via RADIUS. With *NTX Access Control Services* you can use the power of templates

System Requirements: Windows NT4/ 2000/XP, Pentium or better, 200Mhz, 256Mb RAM (all components) minimum, 30Mb disk space minimum.
